Mini Transition Feeder

For supplementary feeding pre-weaned piglets in the farrowing house

The **Mini Transition Feeder** is installed in the division between **two farrowing pens** to assist the stockman in **improving pre and post weaning performance.** Offering a **supplementary** feed of freshly mixed creep and water, it offers new strategies for dealing with **large litter numbers**.

The Mini Transition Feeder achieves:

- ☑ Creep Feeding from day one
- ☑ Reduced requirement for cross fostering
- ☑ Supports early development of the digestive system

Supplementary Feeding results in:

- ☑ Greater homogeneity of the piglet's weight and vitality at weaning
- ☑ Improved post-weaning Transition
- ☑ Increased litter weights
- ☑ Improved maintenance of sow condition during lactation

"They are doing what we hoped, the piglets are bigger at weaning and appear to do better post weaning"
