Transition Feeder

For maximum intake of feed in the post weaning period

The Transition Feeder achieves:

- A smooth Transition from sows milk to dry feed or to wet feed systems where the requirement for small quantities of freshly mixed liquid feed is a challenge
- A smooth Transition from periodic suckling on the sow to ad-libitum feeding without scouring
- A smooth Transition continuing the piglets positive growth curve from the first day of weaning

Features:

- Instant mixing of feed
- Always fresh food at feeding
- Adjustable meal-water ratio
- Warm water version available
- For up to 50 piglets from 4 days old to 15kg

Improved feed intake at weaning results in:

- Reduced stress at weaning
- Reduced post weaning diarrhoea and digestive problems
- Improved conformity of pig weights in the nursery and through to finish
- Improved overall life performance
